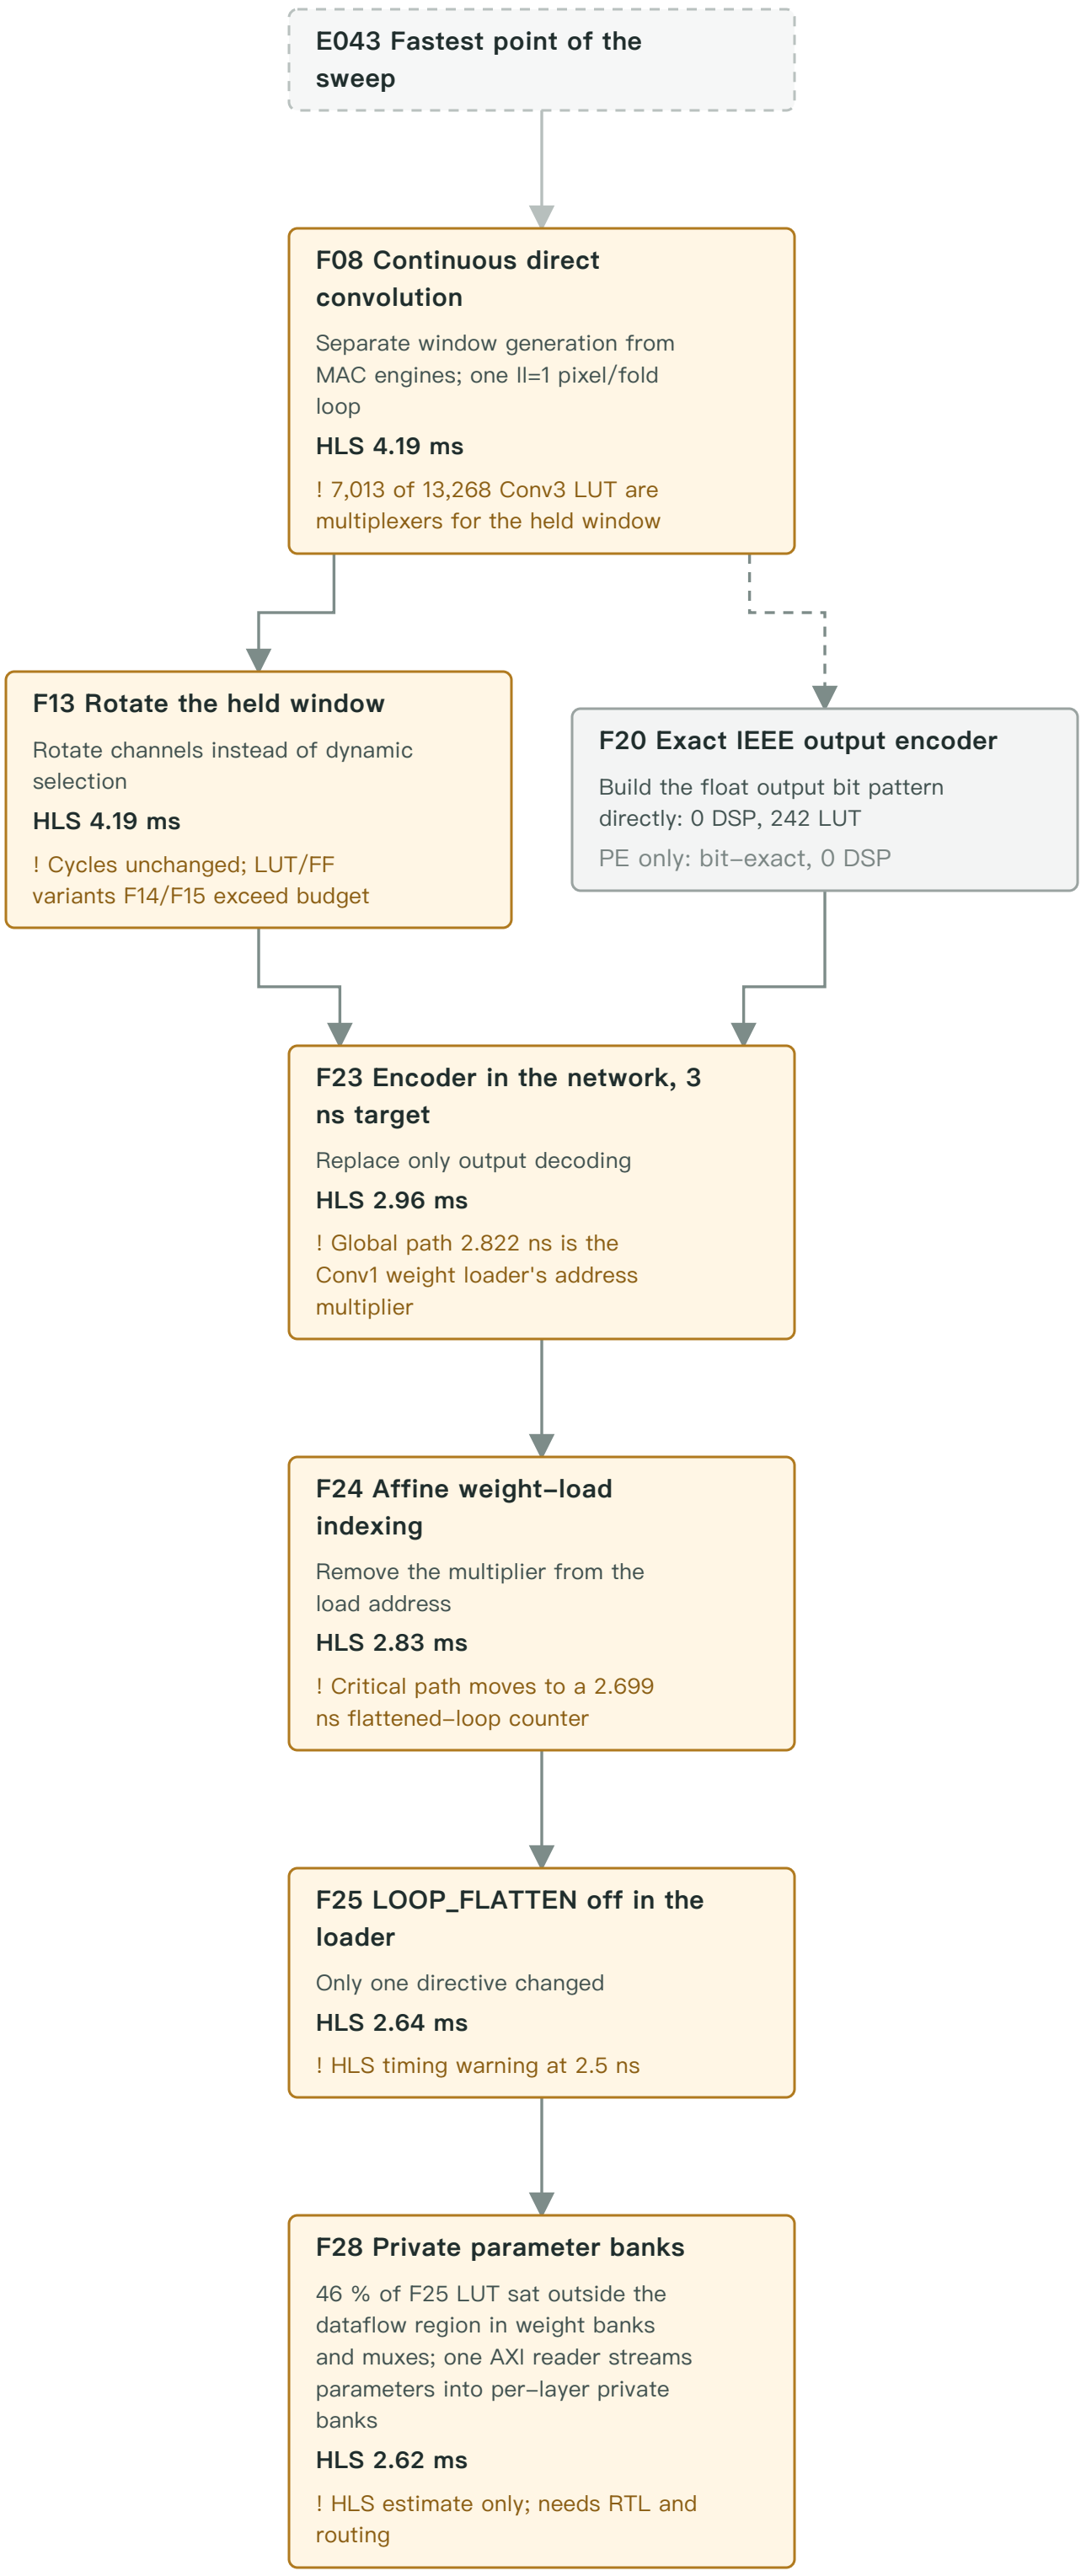
SRCNN on KV260: experiment evolution：Phase 2: continuous direct-convolution mainline

Condensed from 231 registered experiments (results.csv). Only turning points are drawn; every ID links to experiments/<ID>_*/. Numbers are ms/frame; the evidence level is stated on each node.

Metric: ms/frame = cycles x clock period. HLS = HLS estimated cycles x target clock; RTL x routed = C/RTL co-simulation cycles x an independently closed post-route clock. No value is a board measurement.

Solid: baseline or parameter evolution, retry after fix, integration of an existing module; dashed: numerical evidence or inspiration, control, verification of the same design, replay. Edges are design lineage, not Git history.


passed, comparable metric (★ selected) · passed with warning · failed or below gate · invalid configuration · timeout or interrupted · planned, not run · analysis · partial experiment, no whole-design metric
